Patent No. 6413740

GENERAL INFORMATION:

APPLICANT: Valenzuela et al., David M.

TITLE OF INVENTION: NOVEL TYROSINE KINASE RECEPTORS AND LIGANDS

TITLE REFRENCE: RECEPT-US

CURRENT APPLICATION NUMBER: US/09/077,955A

CURRENT FILING DATE: 1996-09-10

EARLIER APPLICATION NUMBER: PCT/US96/20696

EARLIER APPLICATION NUMBER: 09/644,271

EARLIER APPLICATION NUMBER: 09/644,271

EARLIER FILING DATE: 1996-05-10

EARLIER FILING DATE: 1996-05-10

EARLIER FILING DATE: 1996-12-13

EARLIER FILING DATE: 1996-12-13

EARLIER FILING DATE: 1996-12-13

EARLIER FILING DATE: 1996-12-15

EARLIER FILING DATE: 1996-12-15

An assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis comprising detecting an isomerized or optically inverted protein in a sample.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to an assay for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The assay involves measuring (in a biological sample) the amount or presence of an isomerised or optically inverted protein or one or more isomerised or optically inverted fragments from proteins such as perlecan, biglycan, decornin, fibrillin-1 or protocadherin. The assay is useful for the diagnosis or assessment of the severity of osteoarthritis or rheumatoid arthritis. The present sequence is human perlecan protein
                                                                                                                                             Human; diagnosis; osteoarthritis; rheumatoid arthritis; perlecan.
                                                                                                                                                                                                                                                                                                                                                                               Christgau S, Henriksen DB, Cloos PAC;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents a human protein, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymucleotide sequence belonging to the perfectan, precursor of the retinol-binding plasma protein, precursor of the grapiloside GM2 activator, calgranulin B or asposin B protein degenerative, neurological and/or auto-immune disease. The polymucleotides and polypeptides are used for dispussis, prognosis, prevention and treatment of multiple sclerosis (in its various forms and phases). They may also be useful in cases of e.g. Alzheimer's and parkinson's diseases, amyotrophic lateral sclerosis, theumatoin polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisense sequences). They can also

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PRE) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed
                                                                                                                                                        9
be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells

genes. (1) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supperpinent. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymuleoride sequences have applications in polypeptide and polymuleoride sequences have applications in a diagnostics. Forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. The present sequence represents a human polypeptide, which is used in the method of the invention. The specification describes a method which uses at least one polypeptide or polymotleotide sequence belonging to the paralecan, precursor of the retinol-binding plasma protein, precursor of the ganglioside GW2 activator, calgranulin B or saposin B protein familiaes. The method is used for detecting, preventing or treating a familiaes. The method is used for detecting, preventing or treating a polymotleotides and polypeptides are used for diagnosis, prognosis, polymucleotides and polypeptides are used for diagnosis, prognosis, prakinson's diseases, amyotrophic lateral sclerosis, including to a parkinson's diseases, amyotrophic lateral sclerosis, rheumatoid polyarthritis and lupus erythematosus, including use as vaccines and in gene therapy (expression of sense or antisenses sequences). They can also be used to assess efficacy of potential therapeutic agents, particularly compounds that reduce or inhibit toxicity towards glial cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ò

```

```
The present invention relates to the isolation of novel human polypeptides referred to as NOVX (NOVI-NOV4), variants of these proteins, and the polynucleotide sequences encoding them. The NOVI proteins of the invention are G-protein coupled receptor (GPCR) related proteins. The sequences of the invention are useful in the manufacture of a medicament for retaining a syndrome related to a human disease associated with the polypeptides e.g. cancer. ABUS2311-ABUS2408 represent the human NOVX proteins of the invention

The present invention relates to the isolation of novel human uterine motility-association polypeptides, and cDNA (AAS28936-AAS28994) and genomic sequences encoding for these polypeptides. The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and amount, and menstrual disorders. The polymucleotide sequences of the invention are also useful in gene therapy. AAD18094-AAD18152 represent novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fire published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            90 DAP----GOYGAYFHDDGFLAFPGHVFSRSLPEVPETIELBVRTSTASGLLLWQGVEVGE 145

The invention relates to isolated mucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a alleviating symptom associated with the disorders and in diagnostic alleviating symptoms associated with the disorders and in diagnostic immunossays e.g. radioimmunoasays or enzyme linked immunosorbant assays (ELISA). Disorders which are diagnosed or treated include autoimmune disease e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cerboral schaemis, angiogenesis, necypasms of the breast or liver, cardiovascular disorders e.g. corneal infection, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, can also be used to aid wound healing and epithelial cell proliferation, cransplantation, for supporting cell culture of primary tissues, to transplantation, for supporting cell culture of primary tissues, cransplantation, for supporting cell culture of primary tissues, cransplantation, for supporting cell culture of primary tissues con also be used content, lipid, protein, carbohydrate, vitamins, miterals, cofactors and other nutritional components. The present content, lipid, protein of the invention. Note: The sequence represents a novel secreted protein of the provention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel polypeptides and polynucleotides useful as diagnostic reagents to diagnose diseases or disorders associated with aberrant expression or activity of polypeptides, for treating blood clotting disorder, hemophilia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Claim 11; SEQ ID NO 252; 601pp; English.

These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          34 EHEENPCOLREPCLHGGIC----QGTRCLCLPGFSGPRCQQGSGHGIAESDWHLEGSGGN 89

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the isolation of novel human calciumbidding proteins, and CDNA (AAA31577-AAS31654) and genomic sequences of encoding for these proteins. The sequences of the invention are useful in the diagnosis, prevention and/or prognosis of diseases associated with aberrant calcium flux. Such disorders include neurological diseases (e.g. amplotrophic lateral sclerosis, ALS), immune dysfunction (e.g. severe combined immunodeficiency, SCID), diseases (e.g. acquired bowel syndrome, IBS), neoplastic disease (e.g. acquired immunodeficiency syndrome, AIDS). The novel calcium-binding proteins are also useful as screening tools to identify antagonists and/or agonists that may enhance or inhibit activities mediated by calcium-binding proteins. The polynucleotides of the invention are also useful in gene therapy. AAU19952-AAU1996s represent the novel human calcium-binding proteins. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Isolated nucleic acid molecule encoding a calcium-binding protein is used in preventing, treating or ameliorating a medical condition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Match 21.9%; Score 343; DB 4; Length 238; Local Similarity 33.5%; Pred. No. 3.6e-18; Local Similarity 34; Mismatches 97; Indels 4
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 11; SEQ ID NO 158; 542pp; English.

The invention relates to an isolated polypeptide comprising a sequence at least 90% identical to a full length protein sequence selected from 55 sequences given in the specification, or the encoding sequence of 163, 74 or 140 amino acids fully defined in the specification, or the encoding sequence or HTMSMO1. The protein and its encoding nucleic acid are useful for the protein and its encoding nucleic acid are useful for diagnosing a pathological condition in a subject and for preventing, treating or ameliorating a medical condition. The protein its encoding nucleic acid and an isolated artibody that can bind to the protein are useful in treating, preventing, diagnosing and/or prognosing immunodeficiations, graft-versusdiangoing and/or prognosing immunodeficiations, graft-versusdiangoing and/or prognosing immunodeficiations, graft-versushest disease, blood-related disorders, inflammatory conditions, graft-versusher disorders, candiovascular disorders, reproductive system curvological disorders, endocrine disorders, reproductive system disorders, and/or diagnose neuronal damage which occurs in certain neuronal disorders or neuro-degenerative conditions, for stimulating for treat, prevent, and/or diagnose neuronal damage which occurs in certain characteristics such as body height, weight, hair color, and to increase or decrase storage capabilities, far content, lipid, protein, green carbohydrate, vitamins, minerals, cofactors or other nutritional components. The mucleic acid of the invention can be used in gene characteristics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            90 DAP----GQYGAYFHDDGFLAFPGHVFSRSLPEVPETIELEVRTSTASGLLLWQGVEVGE 145

The invention relates to novel genes (ABV83682-ABV84101) and proteins (ABP66710-ABP67129) useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. The genes are isolated from a range of human tissues disclosed in the specification. The nucleic acids, proteins, antibodies and (ant) agonists are useful in the diagnosis, treatment and prevention of: (a) cancer, e.g. breast and ovarian cancer and other cancers of the adrenal gland, bone, bone marrow, breast gastrointestinal tract, liver, lung, or urogenital; (b) immune hasenia, autoimmune thyroiditis, diabetes mellitus, Crobn's disease, multiple sclerosis, rheumatoid arthritis and ulcerative colitis; (c) cardiovascular disorders such as myocardial ischaemias; (d) wound healing; (e) neurological diseases e.g. cerebral anoxia and epilepsy, and (f) infectious diseases such as viral, bacterial, fungal and parasitic infections. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pot_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       166 GARTGKSPGMMRQLNINGALYVGGMXEIALHTURQYWRGLVGCISHFTLST-----DY 218

The invention relates to novel isolated polynuclectides (I) encoding extracellular matrix (ECM) polypeptides. (I) and a polypeptide encoded by (C extracellular matrix (ECM) polypeptides. (I) and a polypeptide encoded by are used to prevent, treat or ameliorate a medical condition in e.g. the polypeptides of the polypeptides or sheep. They are also used in diagnosting a pathological condition. The antibodies to the polypeptides can also be used in alleviating symptoms associated with the disorders and in used in alleviating symptoms associated with the disorders and in used in alleviating symptoms associated with the disorders and in diagnostic immunoassays (ELISA). Disorders which are diagnosed our treated include autoimmune diseases e.g. radioimmunoassays or enzyme linked include artesit, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound suburn, to maintain organs before transplantation, for supporting cell culture of primary issues, to regenerate tissues and in chemocaxis. The polypeptides can also be used as a food additive or preservative to increase storase storase capabilities. The present sequence of novel human extracellular matrix are incomplements.
                                                                                                                                                                                                                                                                                                                         antiproliferative; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; ophthalmological; extracellular matrix; ECM; autoimmune disease; rheumatoid arthritis; hyperproliferative disorder; neoplasm; cardiovascular disorder; cardiar arrest; cerebrovascular disorder; nervous system disorder; Alzheimer's disease; ocular disorder; wound healing; food additive.
                                                                                                                                                                                                                                                                                                        Human; immunosuppressive; antiarthritic; antirheumatic; cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New nucleic acids encoding extracellular matrix polypeptides, for diagnosing, treating, preventing or ameliorating human disorders ar disease, such as, autoimmune, hyperproliferative or cardiovascular
                                                                                                                                                                                                                                                           Novel human extracellular matrix (ECM) protein #4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Fiscella M, Shi Y, Ebner R, Ruben SM;

The sequences of the invention are useful in the diagnosis, treatment, prevention and/or prognosis of diseases associated with uterine motility such as pregnancy and labour, and menstrual disorders. The polymucleotide sequences of the invention are also useful in gene therapy, AAU18094-AAU18152 represent novel human uterine motility-association polypeptides. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                34 EHBENPCQLREPCLHGGTC----QGTRCLCLPGFSGPRCQQGSGHGIAESDWHLEGSGGN 89

Claim 11; SEQ ID NO 179; 601pp; English.

The invention relates to isolated nucleic acid molecules and their encoded secreted proteins. The nucleic acids and proteins are used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. Antibodies to the proteins can also be used in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassays or enzyme linked immunosorbant assays (ELSA). Disorders which are diagnosed or treated include autoimmune diseases e.g. rheumatcid arthitis, hyperproliferative disorders e.g. cerebras, susceed by necrois system disorders e.g. crebrins, insections caused by necrous system disorders e.g. Alzabeimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection, and many other disorders listed in the specification. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to respensate tissues and in chemotrasis. The polypeptides can also be used to nicemporatis. The polypeptides can also be used diditive or preservative to increase or decrease storage as food additive or preservative to increase or decrease storage capabilities, fat content, lipid, protein, carbohydrate, the present minerals, offactors and other nutritional components. The present sequence represents a novel secreted protein of the invention. Note: The

The present invention provides human cDNAs, proteins and related genomic DNAs. These can be used in the treatment of neural, immune system, muscular, reproductive, gastrointestinal, pulmonary, cardiovascular, renal and proliferative disorders and inflammation. The present sequence is a protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               21.9%; Score 343; DB 4; Length 432;

--- TISSUE SPECIFICITY: Found in the basement membrane of all contractile tissues. It is concentrated over muscle dense bodies and M-lines which are associated with beta-integrin.
--- IDVELOPMENTAL STAGE: Synthesized early in embryogenesis.
--- SIMILARITY: Contains 3 LDL-receptor class A domains.
--- SIMILARITY: Contains 16 immunoglobulin-like C2-type domains.
--- SIMILARITY: Contains 3 laminin G9F-like domains.
--- SIMILARITY: Contains 2 laminin G1-like domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Percy C.M., Baynes C.;
Submitted (MAR-1997) to the EMBL/GenBank/DDBJ databases.
                                                                                                                                                                                                                                                                                                 Submitted (FEB-1998) to the EMBL/GenBank/DDBJ databases
